INTRODUCTION

At SHIELD, we are dedicated to serving the needs of the fire protection and building services industries. We have a comprehensive range of quality products designed to the highest local and international standards.

Our commitment to continued research and development ensure that we remain at the forefront of innovative products to bring to the marketplace.

Our worldwide manufacturing facilities are some of the most advanced in the industry. Our experienced and professional staff provide the highest levels of service across engineering, quality, manufacturing, and after-sales support.

With our highly responsive and customer-focused network of distribution centres around the world, we excel at providing outstanding levels of service to our customers.

With offices and facilities in the UK and the Middle East, we can cater to the specific needs of your region and we are justifiably proud of our global client base.

At our manufacturing facility, in the UAE, we produce UL Listed, API, FM Approved, WRAS approved, and Bureau Veritas approved PE Pipes and fittings for use across a wide range of industries and applications in the region.

HDPE System

SHIELDTM
Trusted Worldwide

WRAS
Water Regulations Advisory Scheme

Through a comprehensive and quality focused research program, SHIELD has been leading the industry for manufacturing and supply of HDPE piping system.

SHIELD HDPE pipes and fittings are manufactured as per ISO and AWWA Standards. Products are required to pass strict quality control procedures, and are rigorously monitored throughout the production process, from the inspection of raw materials to the storage of the finished products, to ensure their compliance with relevant quality standards. Review of existing facilities and continual improvements is always a priority, parallel to the consistent production process.

SHIELD High Density Polyethylene Pipes and Fittings are durable and strong for long life installation. This piping system is an effective solution for municipal, industrial, marine, agricultural and firefighting applications. Its efficiency has been tested and proven for above ground, surface, buried, slip lined, floating and sub-surface applications.

SHIELD HDPE is capable of meeting all your piping requirements.

HDPE System

Characteristics of PE:

The figure summarizes many of the key characteristics of the HDPE like:

HDPE System

We recommend SHIELD HDPE piping solution due to its renowned following characteristics:

High Impact Resistance:

(Also referred to as toughness)
This might be one of the most important properties needed in transferring fluids. It is mainly about how strongly this material can withstand a sudden internal or external hit (normally for a buried pipe, a sudden pressure wave inside pipe). This property report the amount of energy this material is capable of absorbing before deforming.

Elasticity:

Despite being very rigid, HDPE stays a polymer material, and this means high degree of elasticity and flexibility. The implications of this are high impact resistance, flexibility and minimum possibility of damaging HDPE material because of rough trench conditions or reduction of massive number of bends. This characteristic also implies that using these flexible pipes is safer especially in applications that need seismic protection.

Thermal Resistance:

The operational safe temperature range of HDPE starts in the cold side from -40°C and ends in the hot side at about 100°C, and this range includes most of applications except the heating applications.

Smooth Internal Wall:

The PE pipe interior is very smooth and guarantees decent flow. Not only this, the smoothness lifetime is much larger than that of steel or ductile iron because PE doesn't rust or rot. The free flow eliminates the possibility of internal deposits which make the inner diameter smaller.

Wear Resistance:

High yield strength, high toughness, and high tensile stress the HDPE resists hard ambience. Even if the bedding used for this type of pipes contains large granules of rock and sand, this material can withstand up to granule diameter size of 65 mm which is really superb.

Weather Resistance:

This property is an extension of thermal resistance and wear resistance properties, which means it can be left in any weather no matter how hard it is and nothing will happen to it. SHIELD HDPE products are UV stabilised carbon black protected.

**Factory
Mutual
System**

HDPE System

Poor Heat Conductivity:

This is one of the most useful properties of HDPE that make it suitable for the applications where it is necessary to secure absence of heat leakage either in or out, like HVAC applications.

Insulation/Sleeve:

This is another property that assures it is always very safe to use HDPE pipes even close to the areas where electric wires may pass or cross. HDPE is a bad conductor for electric current.

Non-Toxic:

This property is inherent from the fact that the HDPE material is inert so the water inside will always be clean and safe. This is a big advantage when HDPE is compared to metal pipes for conveyance of potable drinking water.

Characteristics

Homogeneous Welded Joints:

Many technicians always complain that the welding remains a critical process for the metal pipes, because, the rigidity of metal prevents the full homogeneity of the welding area. While with HDPE, welding is more powerful especially in butt welding, that makes the joints share same properties of the pipe, and even are stronger.

Highly Suitable for Welding:

The main process used for manufacturing HDPE pipes is extrusion which is a hot forming process, that ensures high homogeneity for the end product, which leads to homogeneous formation of the molten material at the time of welding.

Pre-Fabrication:

The HDPE is friendly for pre-fabrication to make customised products, for example segmented fittings can be pre-fabricated from the pipes of same SDR.

Lightweight:

The light weight nature of HDPE pipes and fittings makes it easy for handling and installation in comparison to other materials.

HDPE System

Physical Properties of HDPE:

Characteristics	Units	PE 80	PE 100	Test Standards
Density	gm/cm ³	≥ 0.93	≥ 0.95	BS EN ISO 1183
Minimum Required Strength (MRS)	MPa	8	10	BS EN ISO 1167
Design Stress	MPa	6.4	8	BS EN ISO 1167
Tensile Strength At Yield	N/mm ²	18 - 23	23 - 25	BS EN ISO 527
Flexural Modules (Bend Creep)	N/mm ²	650 - 850	1000 - 1200	BS EN ISO 527
Elongation At Break	%	> 600	> 600	ISO 527
Crystallite Melt Range	°C	128 - 132	128 - 132	DIN 53736
Surface Resistance	Ohm	10 ¹³	> 10 ¹⁴	ASTM D 257, DIN IEC 167
Coefficient Of Linear Expansion	mm/m*k	0.2	0.13	DIN 53752
Heat Conductivity At 20 °C	W/m*K	0.43	0.38	BS EN 12664, DIN 52612
Impact Strength At 23 °C	Kj/m ²	110	83	BS EN ISO 179
Brittleness Temperature	°C	< -70	< -70	ASTM D746
Shore Hardness	D	65	62	ISO 868
Melt Flow Rate (Melt Flow Index - Mfi)	g/10min	0.2 - 1.4	0.2 - 1.4	ISO 1133
Water Absorption	%	0.01 - 0.04	0.01 - 0.04	BS EN ISO 62, DIN 53495

Minimum Required Strength (MRS):

Polyethylene pipes and fittings materials are evaluated on the basis of their Minimum Required Strength.

When PE 100 pipes are hydro-statically tested at 20°C, ISO 1167 specify a Minimum Required Strength at 50 years of 10 Mpa (100bar) - MRS100.

When PE 80 pipes are hydro-statically tested at 20°C, ISO 1167 specify a Minimum Required Strength at 50 years of 8 Mpa (80bar) - MRS80.

The MRS value for PE 100 compound is 10MPa. PE 100 pipe has enhanced toughness, higher permissible design strength and improved resistance to rapid crack propagation in addition to benefits in efficiency and economy. This allows the design engineers to use PE 100 pipes at substantially higher operating pressures than PE 80 pipes with equivalent SDR rating i.e. allows PE 100 pipes to be produced with thinner walls than PE 80 pipes of equivalent SDR rating.

Automated Quality Control System

Introduction:

The production of plastic pipes is largely determined by the high demands on quality control, economic efficiency and productivity. These demands can be met only by up-to-date automation concepts.

The Automated Quality Control product line solves almost all measuring, automation and documentation tasks for single-layer pipes while offering customized process solutions for very specific pipes. Of particular interest is the easy operation of the complete system. This includes, above all, the easy operation of the software, the temperature-independent measuring principle and the automatic centring of the measuring mechanics.

Automated Quality Control system with its electronically rotating sensors covers a broad product spectrum. Process-oriented automatically centring measuring mechanics combined with gravimetry, thermal centring and other modules provide an affordable complete solution for the automation of pipe extrusion lines. Designed especially for the gas pipe and pressure pipe production, the portable is designed for a fast direct measurement independent of pipe temperatures. It is able to carry out a 100 % wall thickness measurement of pipe diameters.

Benefits:

- ▶ Comprehensive product information (wall thickness, diameters, eccentricity, ovality)
- ▶ Absolute measurement Automatic centring
- ▶ Independent of pipe temperatures
- ▶ Maintenance-free
- ▶ Material savings of 5% or more through s-min control or thin points control, improved centring process and a systematic start-up of the extrusion line
- ▶ Documentation for submission to the customer
- ▶ Proven control principles
- ▶ Easy connection to extruder control
- ▶ Easy to use, thus low training need

HDPE System

Design Stress & Safety Factor:

Safety factors are taken into account for handling conditions, service conditions and other circumstances not directly considered in the design. In terms of ISO 4427 the minimum safety factor is 1.25. This factor, when applied to the Minimum

Required Strength (MRS), for the particular material classification (e.g. PE 80, PE 100), gives the maximum allowable hydrostatic design stress for the designated material.

Designation of Material	MRS at 50 years & 20°C (Mpa)	Hydrostatic Design Stress (Mpa)
PE 100	10	8
PE 80	8	6.4

Formula: $\frac{MRS}{c}$, $c=1.25$

Pipe SDR & Pressure Relationships:

SDR is the standard dimensional ratio, it is the ratio between the O.D. (Outside Diameter) of the pipe & the wall thickness. E.g.:

As per ISO 4427, the SDR of 110mm 10 bar rated PE 100 pipe is $110/6.6 = 16.66$ i.e. SDR 17

As per ISO 4427, the SDR of 110mm 16 bar rated PE 100 pipe is $110/10 = 11$ i.e. SDR 11

As per ISO 4427, the SDR of 110mm 20 bar rated PE 100 pipe is $110/12.3 = 8.94$ i.e. SDR 9

Material	Design Stress (Mpa)	Nominal Pressure (PN)								
		4	5	6	8	10	12.5	16	20	25
PE 100	8.0	SDR 41	SDR 33	SDR 26	SDR 21	SDR 17	SDR 13.6	SDR 11	SDR 9	SDR 7.4
PE 80	6.4	SDR 33	SDR 26	SDR 21	SDR 17	SDR 13.6	SDR 11	SDR 9	SDR 7.4	SDR 6

HDPE System

Pressure Reduction Co-Efficient for PE 100 as Per ISO 4427:2007:

When a HDPE piping system is operated at a continuous constant temperature higher than 20°C, a pressure reduction co-efficient as given in the below tables are applicable.

From the below table, Pressure rating of different SDRs at various level of temperature can be determined, therefore pipe selection can be made early at the design stage.

PE 100							
Temperature °C	20	25	30	35	40	45	50
Pressure Reduction Co-efficient	1	0.93	0.87	0.80	0.74	0.675	0.61
SDR	Pressure in Bar						
7.4	25.0	23.3	21.8	20.0	18.5	16.87	15.25
9.0	20.0	18.6	17.4	16.0	14.8	13.50	12.20
11.0	16.0	14.9	13.9	12.8	11.8	10.80	9.76
13.6	12.5	11.6	10.9	10.0	9.3	8.40	7.60
17.0	10.0	9.3	8.7	8.0	7.4	6.80	6.10
21.0	8.0	7.4	7.0	6.4	5.9	5.40	4.90
26.0	6.0	5.6	5.2	4.8	4.4	4.00	3.70
33.0	5.0	4.7	4.4	4.0	3.7	3.40	3.00
41.0	4.0	3.7	3.5	3.2	3.0	2.70	2.40

HDPE System

Manufacturing Process:

SHIELD manufactures Polyethylene Pipes and Fittings with a combination of advanced technologies, tested and proven materials and efficient factory production techniques. The facilities are equipped with state of the art technologies, operated by a team of highly skilled personnel.

The manufacturing facilities are being inspected on an ongoing basis, and passes both scheduled and unscheduled inspections. Strict Quality Control procedures are conducted on a routine basis throughout the entire production cycle from the inspection of the raw materials to the storage of the finished goods to ensure products compliance with the relevant standards.

SHIELD's high-tech laboratory consists of modern calibrated machines to meet stringent quality standards.

HDPE System

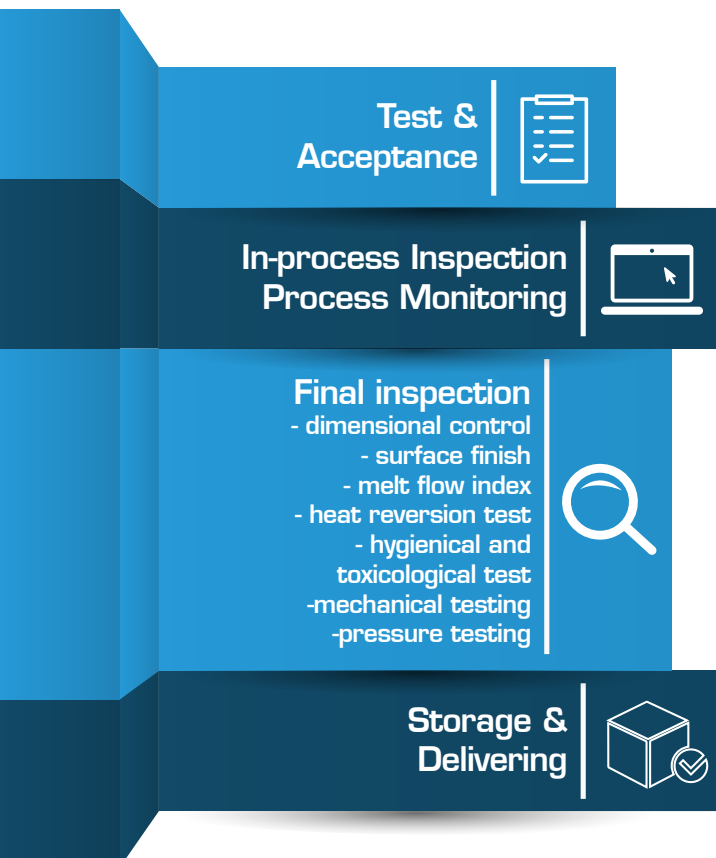

Quality Control:

SHIELD facilities are equipped with latest tools and technologies which can handle all the related processes of strict quality control which are routinely conducted throughout the production process from the inspection of raw materials to the finished goods. Rigorous quality control procedures are carried throughout the manufacturing process from bringing in the raw material to the delivery & storage of finish products.

Apart from the manufacturing process, SHIELD also provides on-site engineering, technical and installation assistance.

Quality Control Procedure:

- 1 Raw Materials
- 2 Production
- 3 In-process Inspection
- 4 Final Inspection
- 5 Storage, Packaging & Dispatch

HDPE Pipe (PE100) Technical Data as per ISO 4427:

Pipe Sizes & Corresponding Wall Thickness at Different SDRs is as follows:

SD-PEPW

NOTE:

- Refer to FM & WRAS certificates for more information.
- PN values are based on C=1.25.
- Tolerances in accordance with grade V of ISO 11922-1:1997.
- The calculated value of e-min (ISO 4085:1998) is rounded up to the nearest value of either 2.0, 2.3 or 3.0. This is to satisfy certain national requirements.
- For practical reasons a wall thickness of 3.00 mm is recommended for Electro-Fusion jointing and lining applications.
- Upto 110mm Shield pipes are also available in coils.
- Please contact us for more information.

Water Line

HDPE Pipe Selection (Bore Size):

Design Engineers choose SHIELD PE 100 piping system, as the system provides larger bore size because of its lower wall thickness. Moreover, at the same working pressure, designers can opt for lower SDR level pipe than in PE 80 piping system.

Bore Size of PE 100 as per **ISO 4427 & AWWA C906**:

SD-PEPW

Pipe Size mm	ISO 4427 - PE 100				Pipe Size Inch	AWWA C906 - PE 100

- NOTE:
- ▶ For installation instructions please refer to our technical guidelines.
 - ▶ UL Certificate for AWWA Standard.

Gas Line

PE Pipe Technical Data as per ISO 4437 & BS EN 1555:

SHIELD Polyethylene is the right choice for your Gas application due to its characteristics such as strength, flexibility, inertness, quality, light weight and ease of maintenance and installation. SHIELD PE pipes are maintenance free with a design life of over 50 years under normal operating conditions.

SHIELD manufactures PE pipes for GAS service as per ISO 4437 & BS EN 1555 standards which undergo rigorous quality checks throughout the entire production process to ensure their reliability and effectiveness for gas transportation. The preferred series of pipes are SDR 11 and SDR 17 for gas applications.

Pipes are available in coils of 50 and 100 meters for sizes up to 160mm in order to reduce the number of joints to make a cost effective choice for contractors and clients. Pipes are also available in straight lengths of 6 or 12 meters. The jointing can be done by Butt-Fusion or Electro-Fusion methods, providing a completely homogeneous leak free system.

NOTE:

- ▶ SDR 11 & SDR 17 are the series commonly used for gas application.
- ▶ Other SDRs are also available upon request.
- ▶ Outer diameter & Wall thickness is according to ISO 11922-1.
- ▶ For applications above 20 Deg C – suitable de-rating factors apply.
- ▶ PE 100 Minimum Required Strength (MRS) is 10 Mpa.
- ▶ PE 80 Minimum Required Strength (MRS) is 8 Mpa.
- ▶ All dimensions for BS EN 1555 are same as ISO 4437 except for 20 & 25 mm (min 3mm Wall Thickness for SDR 11).
- ▶ Please contact us for more information.

Fire Line

HDPE Pipe Technical Data:

SHIELD HDPE pipes are manufactured complying to ISO 4427 (metric) and ANSI/AWWA C906 (inch) standards. SHIELD produce and supply moulded and segmented fittings as per ISO and AWWA standards under stringent quality control. Our pipes and fittings are tested at each stage of production to comply with quality and standards.

Hydrant Installation:

Where local soil does not provide the needed support for the HDPE pipe, heavy thrust blocks or dense concrete mixes can sink. When a large thrust block sinks, it creates excessive bending moment and failure which must be avoided. Where good local soil conditions exist, no thrust block or special bedding is required. If local soil conditions support the use of geo-textile fabrics or stabilized soils offer another way to provide good proper support to pipe and fittings to prevent excessive bending should be used.

Drainage Line

HDPE Pipe Technical Data as per BS EN 1519-1:

SHIELD also provides an effective and economic alternative to cast iron and other traditional systems for drainage applications. The SHIELD HDPE drainage system is a total solution for all types of drainage requirements, soil and waste include above and below ground, and chemical waste applications. The exceptional performance is the result of versatile characteristics of SHIELD HDPE, which make the system fit for long term solution as compared to cast iron and other traditional systems. Its Corrosion resistance and ability to withstand in different temperature makes it suitable to use in chemical and greasy kitchen waste applications.

What makes SHIELD HDPE Piping System a great alternative solution?

- ✓ Corrosion & Abrasion resistance
- ✓ Chemical resistance
- ✓ Impact resistance
- ✓ Heat Resistance
- ✓ Low weight, flexible and Easy to install
- ✓ Ideal for prefabrication and recyclable.

Areas of application

SHIELD HDPE Drainage Pipe is suitable for Laboratories, Factories, Hotels and Domestic/ Commercial/Industrial buildings.

Standards

SHIELD HDPE Drainage pipes are manufactured in accordance with the European standard BS EN 1519-1 which supersedes the German standards DIN 19535-1 and DIN 19535-2.

Dimensions of HDPE drainage pipes according to **BS EN 1519-1:**

SD-PEPD

Nominal Outside Diameter	Outside Diameter		Wall Thickness S 16		Wall Thickness S 12.5	
	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum

315	315.0	317.9	9.7	10.9	12.1	13.6

NOTE:

- ▶ Series 16 (S 16) is suitable for application area inside buildings and outside buildings fixed on the wall.
- ▶ Series 12.5 (S 12.5) is suitable for application area under and within 1 metre from the building where the pipes and fittings are buried underground and connected to the soil and waste discharge system of the building.

SHIELD HDPE PIPE ISO 4437 PE 100

SHIELD MDPE PIPE ISO 4437

SHIELD HDPE

HDPE Fittings

Introduction:

SHIELD supplies a wide range of fittings used in PE piping industry, this range includes fittings for butt welded, Electro-Fusion welded and flanged connections.

These butt-welded fittings are of two types, moulded (injected) fittings and segmented fittings. The difference lies in the method of manufacturing. Moulded fittings are manufactured by injection moulding and segmented fittings are manufactured using HDPE pipes of the same class and standard using automatic welding machines that give no room for error to produce a homogeneous product. The high tech methods used for welding ensures the strongest joints. SHIELD fittings are FM and WRAS approved for different areas of usage.

Moulded and segmented fittings are manufactured according to ISO 4427, ANSI/AWWA C906 and BS EN 1519-1 standards.

NOTE:

- ▶ For the details of the FM & WRAS approved HDPE fittings, please refer to respective certificates.
- ▶ Please contact us for more information.

HDPE

fittings complying
ISO 4427 standards

SHIELD fittings are available in moulded & segmented. They are manufactured as per ISO standard which are FM and WRAS approved, applicable for firefighting & water applications.

NOTE: Please contact us for more information.

NOTE:

- ▶ The tolerance limit for the dimensions (Z, L, L1 & h) will be ±5 mm.
- ▶ e = Thickness at the end.
- ▶ SDR 11 - 16 bar water/10 bar gas.
- ▶ This product "Stub Flange" is usually used with G.I. backing ring and an EPDM rubber gasket, the whole assembly is called flange adapter set.
- ▶ Refer to FM & WRAS certificates for more details.
- ▶ Other SDRs and sizes are also available upon request.

H D P E

fittings complying
ANSI/AWWA standards

SHIELD moulded & segmented fittings are manufactured as per ANSI/AWWA C906 standards which meet the National Fire Protection Association (NFPA) requirements. Fittings are FM & WRAS approved, available in DR 11, DR 9, DR 7.3 & DR 7.

NOTE:

- ▶ Refer to FM & WRAS certificates for more information.
- ▶ Please contact us for more information.

HDPE

fitting accessories

SHIELD provides state-of-the-art fitting accessories for joining HDPE piping system which not only ensures the safe conveyance but also makes it possible to easily move HDPE pipes at a later stage.

NOTE: Please contact us for more information.

Fusing

solutions for HDPE
Pipes & Fittings

Fusion Machines

SHIELD supplies fusion machines for the jointing of HDPE pipes and fittings. All the fusion machines are designed and built according to International standards.

Butt-Fusion Machines:

For jointing HDPE pipes it is the most common method used for pipes to be jointed, having bigger diameters (larger than 90mm) for many reasons including cost, simplicity, strength of joints, etc.

Butt fusion is used to joint pipes with one another or with the fittings. It is also used for manufacturing segmented fittings. This reliable and strong jointing method withstands the pressure changes and flow conversions critical pressure performance.

The main parts of a butt-fusion machine consists of machine body, hydraulic unit, heater and milling cutter. The clamps are used to fasten the pipes firmly and assure they will not move or slip during the welding process.

If the pipe diameter is smaller than clamps, then it will be necessary to use inserts to make sure that pipe will be firmly fastened. These inserts are metal parts in the shape of arcs that are fixed in the inner periphery of the clamps.

Facts & Benefits of Butt-Fusion:

- ▶ Visual inspection is possible during the welding process.
- ▶ Uniform heating and melting under pressure makes the joint stronger and durable.
- ▶ Jointing of pipes and fittings of different SDRs are not advisable.
- ▶ Proper heating and cooling before and after jointing is important for getting the best results.
- ▶ Butt-fusion joints make pipe system stronger due to formation of beads during the welding process.
- ▶ Beads formed during butt-fusion states the quality of jointing.
- ▶ HDPE pipe fused joints are self-restraining and usually do not require thrust blocks which also nullifies the probability of water leakage.
- ▶ Using a butt-fusion method does not only eliminate the requirements of extra material or support but also gives a cost-effective and long-life solution.

Fusion Machines

Range of Butt-Fusion Machines:

SHIELD provides wide range of Butt-Fusion Machines which are manual, semi-automatic and fully automatic machines to fulfil project requirements ranging from:

- ▶ Basic Line: Set of machines (160 to 355) covers pipe diameters from 40mm to 355mm. Basic line machines are Manually operated hydraulic machines.
- ▶ Basic Easy life: Set of machines (160 to 355) covers pipe diameters from 40mm to 355mm. Basic Easy line machines are Semi-automatic hydraulic machines capable of storing and retrieving welding information to get joint reports.
- ▶ Delta Line: Set of machines (500 to 1600) covers pipe diameters from 200mm to 1600mm. DELTA line machines are self aligning hydraulic machines.
- ▶ Delta Easy life: Set of machines (500 to 630) covers pipe diameters from 200mm to 630mm. Delta Easy line machines are Semi-automatic hydraulic machines capable of storing and retrieving welding information to get joint reports.
- ▶ All Terrain-Trailer Line & CNC machines are also available upon request.

General Technical Details:

Working Range:	40 mm to 1600 mm	Power Supply:	110 V Single Phase 50/60 Hz 230 V Single Phase 50/60 Hz 400 V Three Phase 50/60 Hz
Materials:	HDPE, PP, PP-R, PB, PVDF <small>* Contact SHIELD for different materials</small>	Working Temperature:	180°C - 280°C
Total Absorbed Power:	2400 W - 45000 W	Outside Temperature Range:	-10°C - 40°C
Weight Machine Body:	21 Kg - 4800 Kg		

Standard Composition of Machine:

Fusion Machines

Range of Electro-Fusion Machines:

SHIELD provides wide range of Electro-Fusion Machines which includes mainly:

- ▶ Elektra 500
- ▶ Elektra 1000

General Technical Details:

Working Range:	20 - 500 mm to 20 - 1600 mm	Welding Output Voltage:	8 - 48 V
Materials:	HDPE, PP, PP-R	Power Supply:	110 V Single Phase 50/60 Hz 230 V Single Phase 50/60 Hz
Max. Absorbed Power:	3100 W (110 V) 3500 W (230 V)	60% Duty Cycle Output 2:	70 A - 90 A
Connections:	USB for external memory and ESC-POS	Operating Mode:	Bar-code Manual (Numerical code or tension/time)
Max. Output Current:	100 A (110 V) 120 A (230 V)	Outside Temperature Range:	-10°C - 50°C

Welding Hose Length:	3m	Weight Standard Composition:	18 Kg - 20 Kg

Standard Composition of Machine:

Tools & machine accessories for proper fusion welding

Wide range of tools, accessories and spares are available to prepare HDPE pipes & fittings for proper fusion welding. It is important to use proper tools and accessories to execute professional quality welded joint.

Machine Accessories

The Inspector:

It controls, records and generates a PDF report of the entire welding process.

Pipe Scrappers:

It is essential to prepare the plastic pipes and fittings before Electro-Fusion welding. Practical and handy, the pipe scrapers remove the oxidation layer caused by weather and ultraviolet rays.

Universal Aligners:

This tool is used to hold the pipes still and aligned during Electro-Fusion.

Pipe Aligners:

It is an essential and a professional tool for the alignment and support of pipes during Electro-Fusion from Ø 125 mm to 500 mm.

Rollers:

This device is essential for supporting the pipes while they are being welded with the butt fusion machines. The roller minimizes pipe friction and drag force independently of the jobsite conditions.

Pipe Cutters:

It is a professional tool, essential for the manual cut of plastic pipes up to Ø 315 mm.

HDPE Installation Manual

Installation Manual

Joining Methods:

Safety considerations are very important when joining the high density polyethylene piping material, but they are not a part of this document; the user of this joining information must consult and follow the appropriate safety instructions, please refer to the Health and Safety section.

For permanent Joints (FUSION)	For Mobile (detachable) Joints (MECHANICAL)
Electro-Fusion welding	Flanged Joints
Butt-Fusion Welding	Compression Joints
Socket Fusion Welding	Insert Joints
-	Quick release Joints

No chain is stronger than its weakest link is a common saying which can also be applied to the piping system joints.

The main requirements to be fulfilled are hydraulic tightness as well as structural stability of the system. An integral part of any piping system is the method used to joint the system components. Proper engineering design of a system will take into consideration along with the type and effectiveness of techniques used to joint the piping components and appurtenances as well as the durability of the resulting Joints.

The integrity and versatility of the joining techniques used for high density polyethylene pipe allow the designer to take advantage of the performance benefits in a variety of applications.

HDPE pipe and fitting can be assembled into a pipeline network by means of fusion or mechanical assembly techniques depending on the project requirements.

Wide range of fittings are available to cater design flexibility for HDPE piping system.

Installation Manual

Heat Fusion Welding (permanent):

The fundamental of heat fusion welding is to apply heat and pressure for a specified time to the mating surfaces to be jointed. The application of heat and pressure under the correct conditions allows changing the resin's molecular structure to an amorphous state and then fuse them together by application of prescribed force until cooling occurs, returning the material to a crystalline state and creating one homogeneous pipe and also creating a joint as strong as the pipe itself. A fusion of HDPE pipe and fittings can be by Electro-Fusion, Butt-Fusion or Socket fusion.

Electro-Fusion:

Electro-Fusion is a simple method of jointing HDPE pipes in circumstances where butt-fusion is not practicable, such as where valves, elbows and tees must be added.

Typical Electrofusion Joint

Electro-Fusion is most commonly used for jointing pipes up to 250mm diameter, but there is no technical upper limit. Different grades and SDR's of pipe can be connected using Electro-Fusion, again only under controlled conditions.

Electro-Fusion fittings may be of different grade and SDR than the pipes, in which case the lower rating (pipe or fitting) governs the rating of the assembly as a whole.

Electro-Fusion is most commonly used in conventional open cut trenching installation, and in repair works. It is also used for adding new services to existing HDPE mains by means of saddle fittings or tees. It is less well suited to trench-less installation or rehabilitation methods because the fittings protrude on the outside of the pipe.

Electro-Fusion fittings are available in a range of forms; they may be straight connectors, bends, tees, stop ends, reducers, saddle fittings and repair fittings.

Installation Manual

Butt-Fusion:

This is the simplest and quickest method of jointing HDPE pipes of any diameter. Butt fusion is a thermo-fusion process which involves the simultaneous heating of the ends of two pipe/fitting components which are to be jointed, until a molten state is attained on each contact surface. The two surfaces are then brought together under controlled pressure for a specific cooling time and a homogeneous fusion joint is formed. The resultant joint is fully resistant to end loads and has comparable performance under pressure to the pipe itself.

Schematic Butt Fusion Joint

An electrical heater plate is used to raise the temperature of the pipe ends to the required fusion temperature. The butt welding machines have controls to ensure the welding parameters.

Used for jointing pipes and fittings from 90mm diameter to larger. However, it is most commonly used for larger diameter pipes. Butt fusion jointing is equally suited for both coiled and straight pipe lengths.

Only pipes and fittings of the same nominal diameter and SDR should be butt fused.

Due to the low profile of the butt joint, it is ideal for use in Trenchless technology installations; slip-lining, pipe bursting, directional drilling, etc.

During the fusion process internal and external 'weld beads' are formed, however, as they do not add anything to the overall strength they may be safely removed if required.

Inside beads may create minor flow turbulence of liquids or may become an obstacle on which solids in the fluids may become lodged. Furthermore, outside beads may be a hindrance to slip-lining operations.

CAUTION

Proper torquing of bolts of the machine is required to obtain specified performance.

- ▶ Insufficient melt bead may result from an improper fusion joint.
- ▶ Butt fusion Joints are stronger when the melt beads remain intact.
- ▶ Butt fusion can also be used to fabricate a range of fittings, bends, tees, reducers, etc.

Installation Manual

Socket Fusion Joints:

Welding of HDPE pipes by socket fusion fittings where the individual pipe lengths are jointed by heat fusing the outside surface of the pipe to the inside surface of the fitting thus providing a homogeneous joint and is mainly used for smaller diameter range of domestic plumbing applications.

Mechanical Assembly:

Mechanical assembly is used for jointing where neither fusion method is suitable. Most commonly this is when HDPE and other pipe materials are being connected or when HDPE pipe is connected to valves or similar appurtenances made from other materials or in situations requiring frequent dismantling and shifting.

Mechanical assembly requires the use of fittings, generally working on the compression principle, to joint different materials together. Usually an elastomeric sealing ring is provided for pressure integrity, leak tightness and resistance to end loads. Mechanical fittings generally include a stiffener which is placed inside the pipe or fitting to ensure stability when the fitting is compressed. These stiffeners are also designed to withstand end loading where necessary. The fittings also include gaskets which are compressed to effect the seal at the rated pressure of the fitting.

The fittings, which are used in gas and water applications may differ and it is essential to use the correct fitting for the application. If there is any doubt then the manufacturer should be contacted. Similarly the manufacturer's recommendations on installing the fitting, including any limitations on torque to be applied in tightening the fitting, should be followed at all times.

Mechanical jointing may be used to connect different grades and SDR's, with the same limitations as above for the Electro-Fusion method. Special care should be taken to use the appropriate insert stiffeners to the corresponding SDR.

The most widely used mechanical jointing methods include:

Flanged Joints (with Stub Flanges and Backing Plates) - HDPE pipes can be flange-jointed by using HDPE stub flange ends in conjunction with metal backing plates and a sealing gasket to provide a demountable joint or to match up with pumps, valves etc.

Compression Joints - Compression couplers are ideal for pipe systems requiring frequent dismantling and shifting, e.g. economic irrigation of larger areas by using smaller pipe lengths.

NOTE:

- ▶ Dissimilar materials (PE 100 & PE 80) and dissimilar wall thickness (SDR & DR) can be jointed by Electro-Fusion fittings.
- ▶ Only similar materials (PE 100 or PE 80) and same wall thickness (SDR or DR) can be jointed by Butt-Fusion.
- ▶ Dissimilar wall thickness (SDR or DR) may not be jointed by Butt-Fusion.
- ▶ Dissimilar materials (PE 100, PE 80) may not be jointed by Butt-Fusion.

Installation Manual

Installation Procedures:

Polyethylene is a thermoplastic material that when extruded produces a pipe of a flexible nature and to which the principles of flexible pipeline design must be applied not only at the design stage but throughout installation as well.

In particular, the quality of materials and workmanship employed in trench preparation, bedding, backfilling and compaction must be of a high standard, if the full strength potential of the pipeline is to be achieved and pipe deformation limited to that calculated by the design engineer.

The following subsections deal with trench preparation, bedding, backfill and compaction.

Site Conditions:

For each pipeline development, consideration must first be given to the nature of the site in terms of configuration, existing surface material and the likely subsoil component materials.

- ▶ The machinery and equipment necessary to carry out the work
- ▶ The method of installation (i.e. by trenching or guided drilling)
- ▶ The need of imported material for bedding and surrounds
- ▶ The requirements in respect of the surface restoration.

Installation Methods:

Slip Lining and Pipe Bursting are both proven methods for the rehabilitation of existing clay, metal, and concrete for water and sewer lines.

Directional Drilling of HDPE for water and sewer applications has become popular because of reduced restoration costs and efficiencies of installation.

Trenching is another construction method that allows for greater production efficiencies for the proper application.

Generally the width of the trench should be the minimum dimension compatible with safe working and the satisfactory laying, jointing and bedding of the pipe.

Above & Underground Piping Solution

Installation Manual

Underground Installation of HDPE Piping:

HDPE piping is considered “flexible” pipe. Flexible pipes can deflect up to their allowable deflection limit without damage. Flexibility is directly proportional to the Dimension Ratio (DR). Low DR pipes such as DR 7.3 have high resistance to deflection because their flexibility is very low, or conversely their stiffness is high. The depth of cover and anticipated surface loads also affects the particular installation requirements.

Allowable Deflection:

HDPE pipes installed on a curved alignment must be drawn evenly over the entire curve length, and not over a short section. This can lead to kinking in small diameter, and/or thin wall pipes. Pegs or stakes are not permitted to achieve the pipeline curvature as these can result in highly localised stresses. Instead, the pipe should be progressively supported by backfill material as the curve is formed.

Large diameter HDPE pipes (450mm and above) must be jointed together, and then drawn evenly to the desired radius. Care must be exercised during construction to prevent over stressing of Joints and fittings. Where mechanical Joints are used, any joint deflection limitations must be observed. During installation, the minimum allowable bending radius, as shown below, should be observed. For curves of smaller radius, post formed bends or moulded fittings shall be used.

The allowable radii of curvature depends on the temperature of the pipe and the SDR. The following table gives recommended minimum bending radius for pipes at 20°C.

Pipe SDR	Minimum Bending Radius (x DN)
9	12
11	15
13.6	21
17/17.6	25
21	35
26	45
33	65

Installation Manual

In general, there are two objectives to achieve in an installation. The first is to provide an envelope of embedment to protect the pipe from mechanical damage and from the impact of hard objects (pebbles, boulders) in the soil. The second is to provide support against earth and live load pressures, where this is required. The envelope surrounding the pipe is referred to as the "embedment" (see *Underground Piping Installation Diagram*). The earth and live loads are supported by the combination of

the pipe stiffness and the embedment stiffness. Lower SDR pipes will carry more of the load and require less support from the soil. When support from the embedment is needed by the pipe to resist earth and live loads, the embedment material is often compacted. The trench backfill placed on top of the embedment material may also be compacted. Compaction of trench backfill immediately above the pipe facilitates the redistribution of some of the load away from the pipe and into the side-fill soil.

1. Foundation:

A foundation is required only when the native trench bottom does not provide a firm working platform for placement of the pipe bedding material.

3. Bedding:

In addition to bringing the trench bottom to required grade, the bedding levels out any irregularities and ensures uniform support along the length of the pipe.

4. Haunch:

The backfill under the lower half of the pipe (haunches) distributes the superimposed loadings. The nature of the haunch material and the quality of its placement are one of the most important factors in limiting the deformation of HDPE pipe.

5. Primary Initial Backfill:

This zone of backfill provides the primary support against lateral pipe deformation. To ensure such support is available, this zone should extend from the trench grade up to at least 75 percent of the pipe diameter. Under some conditions, such as when the pipe will be permanently below the ground water table, the primary initial backfill should extend to at least 6 inches over the pipe.

6. Secondary Initial Backfill:

The basic function of the material in this zone is to distribute overhead loads and to isolate the pipe from any adverse effects of the placement of the final backfill.

2. Initial Backfill:

This is the critical zone of embedment soil surrounding the pipe from the foundation to at least 6 inches over the pipe. The pipe's ability to support loads and resist deflection is determined by the quality of the embedment material and the quality of its placement. Within the initial backfill zone are bedding, haunch, primary, and secondary zones.

Underground Piping Installation Diagram

7. Final Backfill:

As the final backfill is not an embedment material, its nature and quality of compaction has a lesser effect on the flexible pipe. However, arching and thus a load reduction on the pipe is promoted by a stiff backfill. To preclude the possibility of impact or concentrated loadings on the pipe, both during and after backfilling, the final backfill should be free of large rocks, organic material, and debris. The material and compaction requirements for the final backfill should reflect sound construction practices, satisfy local ordinances & sidewalk, road building, or other applicable regulations.

Installation Manual

Above Ground Applications for HDPE Pipe:

In above ground applications, HDPE piping may be suspended or cradled in support structures or, it may simply be placed directly on the ground surface. When HDPE pipe is utilized outdoors in aboveground applications, it will be subjected to extended periods of direct sunlight. The ultraviolet component in sunlight can produce a deleterious effect on the HDPE unless the material is sufficiently protected. Black pipe (containing 2.0% minimum carbon black) is normally recommended for aboveground use.

Conditions and effects which can influence the behaviour and thus, the design of above ground HDPE piping systems include:

- ▶ Temperature
- ▶ Chemical exposure
- ▶ Ultraviolet radiation
- ▶ Potential mechanical impact or loading
- ▶ Internal Pressure

Anchorage and Thrust Blocks:

One of the fundamental features of fully integrated fusion welded HDPE pipe systems is that they are end load resistant and anchorage is not normally required at the junctions or bends. However, an exception to this are at transition points to non end load bearing piping system where thrust anchoring will be required.

The designer should consider all aspects of the system, including the imbalanced loads imposed by testing procedures, unusual configurations, large temperature variations, etc. and where excessive stress on the pipe system is envisaged, additional anchorage should be considered.

Installation of Hydrants

Installation Manual

Testing & Commissioning:

The standard procedures for testing installed pipelines prior to commissioning. These standards will normally require, as a minimum, the adequate flushing of the service and the testing of all pipes and Joints to the maximum head to which the service is to be subjected.

After being tested, all service pipes must be subjected to a final disinfection process before being introduced into the supply system. Special attention must be paid to the proper sterilization of those services laid to hospitals.

Hydrostatic Pressure Pipeline Testing:

Polyethylene is a resilient material, lightweight and easy to handle. Nonetheless, care should be taken not to cause scuffing or gouging of the surface. In addition to the guidelines set out here, the handling and storage of HDPE pipes are covered by codes of practice issued by various utilities (e.g. the WRc manual for HDPE pipe systems for water supply). For example, with blank flanges provided with connections for pressure gauge, pump, breathers etc.

The normal testing procedure used for most pipeline materials requires the application of a nominated hydraulic pressure in the pipeline, then isolating the pressure pump for a period of 1 hour. The success of the test is then judged by the quantity of water required to restore the original test pressure measured against a given formula.

The pipeline must be anchored avoiding the movement of under pressure pipelines, and proceeding with partial trench covering leaving the jointing uncovered for further inspection. The pipeline is filled with water from the most lower-laying point where the manometer must be installed. Particular care is applied for the out coming of air from breathers, cocks etc.

The pipeline is placed under pressure at a value up to 1.5 times the nominal pressure at 20°C for 1 hour. If there is a pressure loss, it is important to measure the necessary quantity of water to restore the testing pressure.

The quantity must not exceed the water quantity, derived from the formula:

$$Q(H_2O) = 0.125 \times L / 1000 \times P / 3 \times D / 25 \times N$$

Where:

Q = Quantity

L = Length in meters

P = Testing pressure in bar

D = Inside diameters in millimetres

N = Number of hours

H₂O = Water

If the test results are positive for 1 hour, the test will continue for next 12 hours under the same pressure value, along with the checking carried out as per the above given calculation.

WARNING

For safety reasons, high density polyethylene pipelines should be tested with water. Air testing is not recommended. Pressure tests are normally conducted at 1.5 times the design service pressure. The total time at test pressure should not exceed 3 hours. Take appropriate safety precautions to eliminate danger to personnel during testing. Risks include sudden movement of pipe, failed bolts and threads on flanges and valves.

Installation Manual

HDPE Piping Hydro-testing Procedures:

Hydro pressure testing should be conducted as follows:

- ▶ Proper backfilling should be provided to the testing pipe & keep the Joints open for inspection.
- ▶ It is necessary to fill, pressurize and test the section within the allotted time for the test.
- ▶ One end of the test section to be closed with the End cap or blind flange and the other end of the test section to be connected with the testing flange having water inlet connected to the calibrated pressure gauge & air out let.
- ▶ Fill the test section slowly with water and ensure that no air is trapped in the test section.
- ▶ Air release valve to be connected to the system at the highest point to expel the trapped air and to get the system completely filled with water.
- ▶ During pressure testing, gradually increase the pressure in the test section to the required test pressure.
- ▶ Add make up water as necessary to maintain maximum test pressure.
- ▶ Monitor the test section at test pressure for the test duration.
- ▶ As per ISO standard, pressure test can be conducted 1.5 times the rated pressure for 2 hours at 20°C.
- ▶ For testing at high temperature, Suitable pressure reduction co-efficient has to be considered.
- ▶ As general practice the testing should be carried out at the earlier hours & late hours of the day to get the established temperature.

Refer below table for SDR 9 PIPES & FITTINGS

Test pressure recommended at various temperatures:

Test Temperature	Pressure De-ration due to increase in Temp	De-rated pressure	Test pressure (1.5 x Rated Pressure)	Test duration
20°C	1.000	20.0	30.00	2 hrs. Max
25°C	0.930	18.6	27.90	2 hrs. Max
30°C	0.870	17.4	26.10	2 hrs. Max
35°C	0.800	16.0	24.00	2 hrs. Max
40°C	0.740	14.8	22.20	2 hrs. Max
45°C	0.675	13.5	20.25	2 hrs. Max
50°C	0.610	12.2	18.30	2 hrs. Max

Refer below table for SDR 11 PIPES & FITTINGS

Test pressure recommended at various temperatures:

Test Temperature	Pressure De-ration due to increase in Temp	De-rated pressure	Test pressure (1.5 x Rated Pressure)	Test duration
20°C	1.000	16.00	24.0	2 hrs. Max
25°C	0.930	14.88	22.3	2 hrs. Max
30°C	0.870	13.92	20.8	2 hrs. Max
35°C	0.800	12.80	19.2	2 hrs. Max
40°C	0.740	11.84	17.7	2 hrs. Max
45°C	0.675	10.80	16.2	2 hrs. Max
50°C	0.610	9.76	14.6	2 hrs. Max

NOTE: Selection of the pipe should be based on the shut off pressure of the Fire pump using for the job

Health & Safety

High Density Polyethylene pipes and fittings have been used safely and effectively throughout the world, in a wide variety of installation conditions for almost 40 years and shall continue to do so in the future.

At all times, the health and safety of operatives and other people involved in the processing, handling, jointing, installation, testing and end user of HDPE piping systems has been of utmost importance to SHIELD. To achieve and maintain these objectives, good working practice is essential. The guidelines for the usage of polyethylene piping systems have been published by several regulatory bodies and they should always be strictly followed.

The Material:

Polyethylene is chemically non-reactive and generally regarded as biologically inert. It is not classified as dangerous product (EEC).

Ingestion:

Ingestion of polyethylene in any form should be avoided.

Inhalation:

Inhalation of HDPE dust can irritate the respiratory system. Wherever possible, when cutting or scrapping HDPE pipes, operatives should work in the open air or in well ventilated areas with proper Personal Protective Equipment (PPE).

Physical Contact:

Polyethylene is not regarded to be a skin irritant.

When cutting or scrapping HDPE pipes or fittings, HDPE dust particles may cause eye irritation and it is recommended that protective eye-wear must be used.

Recycling:

The product is suitable for recycling using modern methods of shredding and cleaning. In-house production waste should be kept clean to facilitate direct recycling.

Disposal of Waste Material:

Surplus or waste HDPE material can be reprocessed for new pipes or other products. Alternatively the disposal should be as per the standard local regulations.

Fire Hazards:

Polyethylene burns, but it is not classified as flammable. It has a flash point of 360°C approx.

Above 300°C, HDPE will degrade to produce carbon monoxide, water and small amounts of various hydrocarbons and aldehyde. Avoid the accumulation of HDPE dust particles as they could give a potential risk of dust explosion.

All electrical equipment in the area should be carefully earthed. In the vent of fire involving HDPE materials, apply water in a spread jet. Dry chemical, foam and carbon dioxide can also be used.

The Environment:

High Density Polyethylene is not considered dangerous for the environment.

NOTE:

- ▶ Drawings are for illustration purpose only.
- ▶ This is only a general information and qualified medical attention should be obtained as soon as practically possible.

Health & Safety

Handling:

HDPE pipes and fittings should be handled and moved in accordance with the instructions detailed in the manuals of regulatory bodies and in the Handling and Storage section of this publication. Particular care should be taken while handling large diameter pipes.

Safety clothing and equipment should be used at all times when handling and moving HDPE pipes. When transporting, handling and releasing coils of HDPE pipes, extreme caution should be taken, particularly with pipes 90 mm and above, dispensing trailer must be used and the details in Handling and Storage section must be strictly followed.

Jointing:

Butt fusion or Electro-Fusion jointing of HDPE pipes and fittings should always be carried out in well ventilated areas. The fusion process is a high temperature operation and fumes are generated around the jointing area. Inhalation of the fumes should be avoided.

During the butt-fusion operation, molten HDPE is formed. This should not be allowed to come into contact with the skin as it will adhere strongly and cause severe burns. Protective gloves should be worn during the jointing process and when using the heater plates of the welding machinery.

During the Electro-Fusion process, care should be taken to prevent the ejection of molten material from the joint. Protective clothing including gloves and safety eye-wear should be worn during the jointing process.

First Aid:

The following are recommendations for immediate first aid to be applied in the event of an accident involving polyethylene products.

Ingestion: Wash the mouth with clean water.

Inhalation: Move the affected person into fresh air situation. If in distress, apply oxygen or artificial respiration.

Eye Injury: If HDPE particles get into the eyes, immediately flush with clean water, repeating as necessary.

Burns: If molten HDPE material comes into contact with skin, cool the affected area immediately by flow of cold water. DO NOT attempt to remove the HDPE material from the skin. Seek medical attention as quickly as possible, even for the smallest burn.

DISCLAIMER

This technical product guide should only be used as a reference and for any clarification, refer to the relevant standards for further information.

NOTE:

- ▶ Drawings are for illustration purpose only.
- ▶ This is only a general information and qualified medical attention should be obtained as soon as practically possible.

Handling & Storage

General Handling:

Although relatively lightweight, polyethylene pipe products should be treated with a similar level of caution as for heavier metallic pipe products. Whilst polyethylene is a robust and resilient material, care should be taken not to cause excessive scuffing or gouging of the surface. Surface damage may occur during handling, storage and installation, but providing the depth, value should not be more than 10% of the wall thickness, only then the service performance of the pipe or fitting will not be affected. Further guidance regarding handling and storage of HDPE pipes and fittings is given by various industry bodies, including the following:

HSE Guidance - Avoidance of danger from overhead power lines (HS GS 6); Protect yourself, protect the load; The lifting operations and lifting equipment regulations (LOLER); The provision and use of work equipment regulations (PUWER).

Department of Transport - Safety of loads on vehicles.
WRc - Polyethylene Pipe Systems For Water Supply (version 01/02).
IGEM/G/8 Handling, Transport and Storage of PE Pipes and Fittings.

Factors of Safe Lifting & Loading:

In lifting operations, where either manual or mechanical effort is involved in moving a load, the following factors are common to all situations and provide the basis on which the selection of the appropriate type of lifting equipment can be made:

NOTE: Drawings are for illustration purpose only.

Rules of Handling & Storage

Never drag or roll individual pipes or bundles

Always store pipes/fittings on flat, firm ground, able to withstand the weight of the material and lifting apparatus

Never throw or drop pipe and fittings from vehicle

Always use non-metal slings when handling pipes/fittings (e.g. nylon or polypropylene)

Never use metal hooks, slings or chains when handling pipes/fittings

Always exercise special care when handling pipes in wet or frosty conditions, since they may become slippery

Never stack pipe bundles more than 3 meters or 3 bundles high

Always keep protective packaging (battens, shrink-wrap, pallets, strapping, etc.) intact until pipes/fittings are required to be used.

Never place pipes/fittings in contact with lubricating or hydraulic oil, gasoline, solvent, or other aggressive materials

Always store pipes/fittings away from intense heat

Never stack coils more than 2 meters high

Always allow some bending deflection when pipes are loaded and unloaded

Never store pipes and fittings near sharp objects

Always protect pipes/fittings with opaque sheeting or tarpaulin

Handling & Storage

Delivery & Unloading at Customer Sites:

The Plastic Pipe Industry - Recommended Guidelines for the Safe Delivery and Unloading of Plastic Pipes to Customer's Site (Health & Safety Charter) has been developed by industry stakeholders to provide a risk-based framework to assist with the safe delivery and off-loading of plastic pipe products. This document has been recommended by the HSE and SHIELD formally adopted these guidelines.

Deliveries should not be made to unmanned sites.

Length & Bundles:

It is the responsibility of the Site In-charge to ensure that the site is safe to accept pipe deliveries. The area where the delivery vehicle is to be stopped shall be safe and the location for storage shall be on firm level ground, which is free from damaging material.

Polyethylene pipe products should be off-loaded in a controlled manner. All polyethylene pipe products shall be mechanically off-loaded and if there is no suitable mechanical off-loading equipment available on-site then an on-board crane vehicle shall be requested. It is the responsibility of the on-board crane operator to off-load polyethylene pipes and he is the only person authorised to access the trailer for this purpose. It is important to maintain an exclusion zone with all personnel and vehicular traffic kept at a safe distance.

Coils:

The delivery driver is responsible for undoing the load securing devices, which should only be removed from the product that is to be imminently off-loaded. The driver is the only person authorised to access the trailer and if off-loading is to be carried out by fork-lift then the driver should be escorted to a safe zone away from the off-loading area by the Site In-charge.

It is the responsibility of the person operating the fork-lift to ensure that the off-loading process is carried out safely. If off-loading is to be carried out by the driver using the on-board crane, then the procedures for handling lengths and bundles should be followed.

Larger coils 90mm - 180mm pipe will require lifting by a fork-lift ensuring that the tines are covered to protect the coils from damage. It is recommended to use anti-slip protective fork covers, which are readily available.

Small coils of pipe delivered on pallets may be handled by forklift, but they should remain secured to the pallet during transportation. Securing bands should only be cut at the time of use. Coils delivered in shrink-wrapped packs should be handled with care to avoid damage.

NOTE: Drawings are for illustration purpose only.
SHIELD reserves the right to change the contents without notice.

Handling & Storage

Site/Depot Handling:

A flat-bed vehicle, free from sharp objects and projections should be used for transporting pipes. When lifting pipe bundles by crane, wideband slings of polypropylene, nylon or similar material is recommended. Do not use chains, hooks or hawsers.

Where large diameter coils are to be stored vertically at depots, the coils must be secured with purpose built racking with protective matting positioned underneath, and facilities for safe lifting, movement and loading must be available.

Storage:

Fittings:

Boxed fittings and pre-fabricated fittings may be stacked on pallets for transport which should be adequately secured. They should be stacked, secured and transported such that no loads are imparted to the fittings. Never use hooks to lift fittings.

Good Lifting Practice

Pipes:

The on site storage facilities will vary depending upon factors such as the available space, location, size and nature of the project etc.

The storage may range from a secure central storage compound, localised storage points close to the laying operation, to stringing the pipes along the planned route. In all cases careful consideration should be given to the following aspects:

- ▶ Security of all materials and equipment from theft, vandalism, accidental damage or contamination (Pipe-end caps, intended to prevent ingress, should be kept in place during storage).
- ▶ Safety of the general public, especially, the elderly and disabled.
- ▶ The movement of traffic, construction equipment, farm machinery and animals.
- ▶ All pipe store locations should be on suitably firm, level ground, free from damaging material with adequate access for construction vehicles and/or lifting equipment.
- ▶ Badly stacked pallets, coils or bundles may slip or collapse, which will cause injury to personnel or damage to the pipe.

Pipe lengths stored individually should be stacked in a pyramid not more than one metre of height, with the bottom layer fully restrained by wedges. Where possible, the bottom layer of pipes should be laid on timber battens. On site, pipes may be laid out individually in strings. (Where appropriate, protective barriers should be placed with adequate warning signs and lamps.)

Bundled packs of pipe should be stored on clear, level ground, with the battens supported from the outside by timbers or concrete blocks. For safety, bundled packs should not be stacked more than three metres of height.

Handling & Storage

Large Coils:

Coiled pipe should be stored flat, especially during periods of warm weather, and on firm level ground, which has suitable protection for the bottom coil. Where space is limited and colours are to be stacked, the height of stacked coils should be such that the stack is stable and the uppermost coil can be safely handled. The height of the stack should not exceed 2.0 metres under any circumstance.

Wedged-end wooden battens placed below the bottom coil and used as spacers between each layer will facilitate easy access for slinging.

When the need for transportation is required, it should only be carried out by trained operatives.

Batches of coils delivered on pallets must remain secured to the pallet and only to be cut at the time of use.

Coil Dispensing:

Safety first: Pipe held in coils, is under tension and is strapped accordingly. Coils may be hazardous if released in the incorrect manner — particularly if the end of the pipe is not kept restrained at all times. It is most important to read and understand the following guidelines before attempting to untie coils.

Coils are secured by one of two methods depending on the pipe's diameter:

1. Outer bands with additional strapping of individual layers (63mm to 110mm).

Do not remove any of these bands until pipe is required for use. Remove them carefully, from the outermost layer first, so that only the length of pipe needed immediately is released. Successive layers can be released by removing band as the pipe is drawn away from the coil.

Coils of pipe should only be dispensed in the field from proprietary trailers.

2. Wrapped coils

Pipe sizes in 32mm and below are protected with the film-wrap, enabling the free end of the pipe to be taken out from the coil. Take the only sufficient pipe for immediate use from the coil and on no account, should remove the outer wrapping until the coil is almost fully unwound.

Handling & Storage

Fittings:

Electro-Fusion fittings should be stored under cover in dry conditions, preferably on racking. They should be kept in their boxes/packaging until ready for use.

Fabricated fittings may be stored outdoors, as long as they are protected against damage and prolonged direct sunlight.

Storage Outside:

Black polyethylene material contains ultraviolet stabiliser to provide excellent protection against degradation due to UV radiation.

Blue and yellow polyethylene is UV stabilised to resist degradation in storage only. The maximum recommended storage outside is 12 months. Product to be stored outside for periods in excess of this, should be covered with polyethylene sheet or stored under cover.

Additional precautions may be required, where polyethylene pipes are stored outdoor in regions of high solar radiation.

Certificates & Approvals

CERTIFICATE

This is to certify that

Shield Fire Safety and Security Ltd.
(Shield Middle East FZCO)
Jebel Ali Free Zone South
Near round about 506,
Street 403
Dubai
UAE

has implemented and maintains an **Occupational Health and Safety Management System.**

Scope:
The Occupational Health and Safety activities and supporting processes associated with Manufacture of Pipes and Fittings, Trading of Sprinklers and Accessories including Deluge Valve and Wet Alarm System, Fire Protection System including clean agent and Inert Gas, Emergency and Exit Lights, Central Battery Systems, Fire Alarm Panels, Valves for Water and Gas Application.

Through an audit, documented in a report, it was verified that the management system fulfills the requirements of the following standard:

ISO 45001 : 2018

Certificate registration no. 20005458 OHS18
Date of original certification 2014-01-06
(BS OHSAS 18001 : 2007)
Date of revision 2023-04-21
Date of certification 2023-03-20
Valid until 2026-03-19

Page 1 of 13

Certificate of Compliance

This certificate is issued for the following:

Polyethylene Pipe and Fittings
(see attached product listing)

Prepared for: Shield Fire Safety and Security Ltd
Unit 3, Endeavour Dr
Building: SS14 3WE
United Kingdom

Manufactured by: Shield Fire Safety and Security Ltd
Jebel Ali, Dubai
United Arab Emirates

FM Approvals Class: 1613

Approval Identification: 3041288 Date Approved: July 6, 2011
Superseded by: RR210750 Date Approved: August 29, 2017
Superseded by: RR220985 Date Approved: November 21, 2019

To verify the availability of the Approved product, please refer to www.approvalguide.com

Said Approval is subject to satisfactory field performance, continuing Surveillance Audits, and strict conformity to the construction as shown in the Approval Guide, an online resource of FM Approvals.

Piping Solution**

Standards & Abbreviations

General Standards:

ISO 161-1:1996	Thermoplastics pipes for the conveyance of fluid - Nominal outside diameters and nominal pressures - Part 1: Metric series.
ISO 4065:1996	Thermoplastics Pipes - Universal Wall Thickness table.
ISO 11922-1:1997	Thermoplastics pipes for the conveyance of fluids - Dimensions and tolerances - Part 1: Metric series.
BS 6437:1984	Specification for polyethylene pipes (type 50) in metric diameters for general purposes.
BS EN 1092-1:2007	Flanges and their Joints. Circular flanges for pipes, valves, fittings and accessories, PN designated. Steel flanges.

Polyethylene Range Is Designed To Comply With The Requirements Of One Or More Of The Standards:

ISO 4427-1,2,3,5 (2007-08)	HDPE pipes and fittings for water supply - General, Pipes, Fittings and Fitness for the purpose of the system.
ISO 4437-1:2014	Plastics piping systems for the supply of gaseous fuels - Polyethylene (PE) - Part 1: General.
BS EN 15494:2015	Plastics piping systems for industrial applications. Polybutene (PB), polyethylene (PE), polyethylene of raised temperature resistance (PE-RT), cross-linked polyethylene (PE-X), polypropylene (PP). Metric series for specifications for components and the system.
BS EN 12201-1:2011	Plastic piping systems for water supply. Polyethylene (PE). General.
BS EN 805:2000	Water supply - requirements for systems and components outside buildings.
BS EN 681-2:2000	Elastomeric seals. Material requirements for pipe Joint seals used in water and drainage applications. Thermoplastic elastomers.
BS 5306-2:1990 or BS EN 12845:2015	Fixed fire-fighting systems. Automatic sprinkler systems. Design, installation and maintenance.
BS EN ISO 8085-1:2001 or ISO 4437-3:2014	Polyethylene fittings for use with polyethylene pipes for the supply of gaseous fuels - Metric series - Specifications - Part 1: Fittings for socket fusion using heated tools.
BS EN ISO 8085-2:2001 or ISO 4437-3:2014	Polyethylene fittings for use with polyethylene pipes for the supply of gaseous fuels - Metric series - Specifications - Part 2: Spigot fittings for butt fusion, for socket fusion using heated tools and for use with Electro-Fusion fittings.
BS EN ISO 8085-3:2001 or ISO 4437-3:2014	Polyethylene fittings for use with polyethylene pipes for the supply of gaseous fuels - Metric series - Specifications - Part 3: Electro-Fusion fittings.
BS EN 1555-1,2,3,5 (2010-12)	Plastic piping systems for supply of gaseous fuels - Polyethylene - General, Pipes, Fittings and Fitness for the purpose of the system.
BS EN 682:2002	Elastomeric seals. Materials requirements for seals used in pipes and fittings carrying gas and hydrocarbon fluids.
DIN 8074:2011-12	Polyethylene (PE) - Pipes PE 80, PE 100 - Dimensions.
DIN 8075:2017-08	Polyethylene (PE) pipes - PE 80, PE 100 - General quality requirements.
DIN 16963:1980	Part-1 High density polyethylene (HDPE) fittings dimensions, type 2.
DIN 3543-4:1984-08	High density polyethylene (HDPE) tapping valves for HDPE pipes.
IGN 4-08-01:1994	Bedding & side fill materials for buried pipelines.
ISO 12176-1,2,3,4 (2003-17)	Plastic pipes and fittings - Equipment for fusion jointing – Butt-fusion, Electro-Fusion, Operators badge, Traceability coding.
ISO 13477/78/79/80	Thermoplastics pipes for conveyance of fluids - Determination of resistance to rapid crack propagation - Small scale steady state test, Full scale test, Test method for slow crack growth in notched pipes (notch test), Resistance to slow crack Growth - Cone test method.
WIS 4-08-02:1994	Specification for bedding and side fill materials for buried pipelines.
WIS 4-24-01:1998	Specification for mechanical fittings and Joints for polyethylene pipes for nominal sizes 90 to 1000.
WIS 4-32-08:2002	Specification for the fusion jointing of polyethylene pressure pipeline systems using PE 80 and PE 100 materials.
WIS 4-32-14:1995	Specification for PE 80 and PE 100 Electro-Fusion fittings for nominal sizes up to and including 630.
WIS 4-32-15:1995	Specification for PE 80 and PE 100 spigot fittings and drawn bends for nominal sizes up to and including 1000.
WIS 4-32-16:1998	Specification for butt fusion jointing machines.
WIS 4-32-18:2003	The choice of pressure ratings for polyethylene pipe systems for water supply and sewerage duties.

List Of Abbreviations:

ANSI	American National Standard Institute	D, d, Ø	Diameter
ASTM	American Society for Testing & Materials	e, e1, e2, c, c1, c2	Wall Thickness
AWWA	American Water Works Association	h	Thickness
BS	British Standard	L, L1, L2, L_n, H, Z	Length
DIN	Deutsche Industrie Normen	R	Radius
ISO	International Standard Organization	DVS	German Welding Society
HDPE	High Density Polyethylene	d	Pipe Outside Diameter
PVC-U	Unplasticised Polyvinyl Chloride	SDR	Standard Dimension Ratio
PVC-C	Chlorinated Polyvinyl Chloride	DR	Dimension Ratio
PP	Polypropylene	WIS	Water Industry Specification
PE	Polyethylene	IGN	Water Industry Information & Guidance Note
PVDF	Polyvinylidene Fluoride	FM	Factory Mutual
EPDM	Ethylene Propylene Diene Monomer	UL	Underwriters Laboratories
NBR	Nitrile Rubber	DN, d_n	Nominal Diameter
PTFE	Polytetrafluorethylene	PN	Nominal Pressure
PB	Polybutylene	Kg	Weight In Kilogram
PBT	Polybutylene Terephthalate	g	Weight In Gram
WRAS	Water Regulations Advisory Scheme	Mpa	Mega Pascal
		Psi	Pounds per square inch

SHIELDTM

Trusted Worldwide

For further information on any aspect of the Shield range of HDPE Piping System, please contact your nearest office.
